# HOW IT WORKS

## OVERVIEW

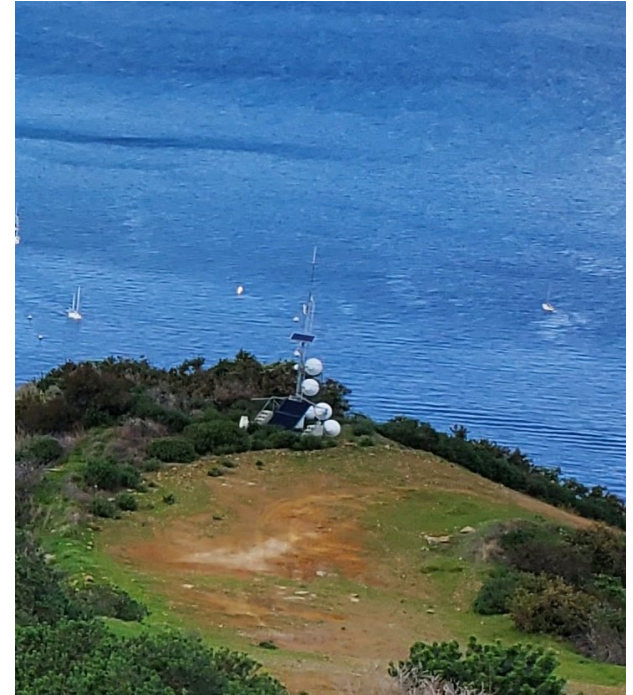

GeoLinks' network has both terrestrial and wireless backhaul and backup (failover) providing the right blend of effectiveness and cost savings.

The "last mile" is delivered to our customer in a form of Microwave radio with a Parabolic antenna attached to it.

Radio frequencies vary depending on the geography of the installation, bandwidth requirements and distance from the Access Point (AP).

Radios are powered by Power over Ethernet (PoE). The PoE injector is located at the DMARC point.

Antenna installation is a none-penetrating setup that will not damage the roof.
